

Hyperspectral Sample Scanner

IS-Scanner

The IS-Scanner is a multipurpose sample scanning stage that interfaces with our line of spectral cameras. It allows fast, easy scanning of samples up to 300 mm long. The width is variable depending on the camera height and objective lens used. The scanner can be used with many types of samples such as documents, powders, seeds, leaves, plants and more. Our CSIspec software operates both the scanner and the camera for simple acquisition of hyperspectral data.

- 50 micron resolution
- USB interface
- Program SDK included
- 300 mm range, expandable to 1000 mm
- Adjustable camera mount
- Mounting bracket for fiber optic line light
